## Project Team

**Kealy Salomon**, AICP, Transportation Program Administrator

**Eoin Wrafter**, Planner

**Dennis Amone**, Graphic Designer

**Mark Northrop**, Intern

Additional Information was provided by *Bill Myers* NYSDOT Traffic Count Section.

## **Summary**

This report includes AADT, (the Annual Average Daily Total number of vehicles that are counted for a day) and peak hour traffic count information for the state, county and local roads in Dutchess County for which traffic count data was obtained in 1998. Roads for which no 1998 data is available are not included in this report.

## **Data Description**

Traffic count data for 16 state highways, 1 county highway and 6 local roads are included in this report. A total of 58 counts were taken. Traffic counts represent the combined total of all lanes of traffic on each road. Therefore, both directions of travel are combined on two-way roads.

There are two tables in this report. Both tables present the same data, each categorizing the data differently. In the first table, the data is categorized by jurisdiction with state roads first, followed by county roads and then local roads. In the second table, the traffic count data is categorized by municipality.

The report includes the following data:

### **Road Name:**

The name of the road which was counted. State roads are listed as 'Rt', county roads as 'CR', and local roads by their common names.

### **Municipality:**

The city, town or village in which the count was taken. C/, T/, and V/ indicate city, town and village, respectively.

### **TCS:**

The Traffic Count Station number. These numbers are assigned by the New York State Department of Transportation for counts that they have done.

### **Section:**

Roads which have multiple counts were counted in sections. These sections are the areas between the "From" and "To" points.

**AADT:**

The annual average daily total (AADT) is the number of vehicles that would be assumed counted on a “typical” day of the year. Based on established formulas, a taken count is factored to an AADT by adjusting it for seasonality and vehicle classifications. Adjusting for seasonality is necessary because each season undergoes an increase or decrease in traffic volumes. Counts are adjusted for vehicle classifications because trucks with three or more axles appears as several cars to the counters.

**Peak Volume:**

For the purpose of this report, the peak volume was chosen to be the traffic count for the hour between 4:00 pm and 5:00 pm for all roads. The actual peak volume may be higher.

**Data Sources**

Traffic counts were gathered by the New York State Department of Transportation.

**Maps**

The maps on pages 9, 11, and 13 show the locations where the traffic counts were taken. Map 1 shows the locations of the state, county and local road counts, with the exception of the cities of Beacon and Poughkeepsie. Map 2 shows the count locations in the city of Beacon, and Map 3 shows the count locations in the City of Poughkeepsie.

Traffic Count locations are identified by a traffic count station (TCS) number.
